

# CentreStage

Build your own  
**datalake**

**Empowering Energy Leaders Globally**

Construct your own datalake from multiple sources including industry dataflows, allowing you to create and manage a hub for utility information through one, structured user interface.

## The central source.

Create, edit, schedule and run your own queries across data imported from any data source. Structure vast libraries of information with integrated dataloaders. Generate detailed analytical reports for unrivalled data analysis and export data using tailored APIs and reporting capability.

CentreStage will query data from any connected data source, including our AFMS platform - using our dataloader functionality. Extract relevant data whenever you need it and save common queries for faster access. Automate more processes by scheduling exports.

**Create, schedule & run your own queries**

The ability to extract information from any data source allows CentreStage to be the host for any or all of your consolidated data. Users can build a hub for essential information, with the functionality to tailor interactivity based on the data you require.

**Central source of imported data**

Having access to this level of data is only useful if information can be clearly presented. We've prioritised user experience with CentreStage, integrating categorical linking, structured grouping and streamlined 'top-down' visibility to simplify data interaction.

**Structured intuitive user interface**

# A single platform that queries, imports, structures and centralises information from any source of data.

**The utilities industry is full of data. Information is spread across multiple platforms and systems, often requiring independent manual querying and data consolidation that takes time.**

Sourcing data from our AFMS platform gives a true industry view of your portfolio; however we understand this only one source of data within your organisation.

We've recognised a clear demand for combining and querying multiple sources of data in one platform, allowing for united reporting and cross system analysis.

CentreStage is a leading solution, providing you with a datalake containing information queried from multiple

sources, supporting the structured export of utility data that can be tailored to your businesses needs.

As well as consolidating and manipulating data from any source, CentreStage can natively validate and extract any industry dataflow into a star schema structure within your repository, utilising ESG's standard industry catalogues.

## **“Centrestage consolidates and manipulates data from any source”**

Our platform excels at providing this information in a clear, easy to understand interface - ready for review, interrogation, analysis and export where required.

### **Proven at scale**

Centrestage is capable of handling millions of dataflows - equal to billions of data groups

**with instant data access**

## Features

### **Comprehensive Query Management**

Create, edit and manipulate your own database of queries

### **Out of the box dataloaders**

Standardised dataloaders for ESG product suite

**Scheduled querying for automation**

### **Scheduled reporting of queries**

Create tailored report schedules that meet your business requirements

### **Structured dataflow repository**

Build your own repository of relevant dataflows

**Advanced analysis & reporting**

**01772 770 280**
